

Create and configure Git Connector from the user interface

Use the Data Sources tool in Experience Manager Guides to create and configure a Git connector from the user interface. After you configure the connector successfully, you can use it to import content from a Git repository into Experience Manager Guides.

1. Select the **Adobe Experience Manager** link at the top and choose **Tools**.
2. Select **Guides** from the list of tools.
3. Select the **Data Sources** tile. The **Data Sources** page is displayed.
4. Select **Create**.
5. From the list of datasource connectors, select **GitHub**.

{width="600"}

6. Select **Next**.
7. Enter the configuration and connection details.

Configuration details

Name * *i*
git-connector

Target AEM root path * *i*
/content/dam/documentation

File type filter (inclusion) *i*
png, md, dita, xml, ditamap

Excluded path (regex) *i*
xyz, *node_modules*

Connection details

Authentication type *
com.adobe.guides.connect.definitions.git.config.NoAuthGitConfig

Repository URL * *i*
https://github.com/dita-ot/docs.git

Branch * *i*
develop

Test connection

AEM Guides GitHub connector to synchronize content from GitHub repositories with intelligent change detection, conflict resolution, and GUID preservation.

{width="600"}

[!TIP]

- Hover over *i* near the field to view more details about it.
- Fields with * are mandatory. For example, you can enter the following details for the ElasticSearch connector.
- **Name:** Enter the name of the data source.
- **Target AEM root path:** Enter the path in the AEM repository where content imported from Git should be stored.
- **File type filter (inclusion):** Specify the file types to include during import.
- **Excluded path (regex):** Specify path patterns to exclude from import.
- **Authentication type:** Select the authentication type from the drop-down list. Currently, **Personal Access Token (PAT)** is the only supported authentication method. Enter the PAT during connector setup to authenticate and access the Git repository.
- **Repository URL:** Enter the Git repository URL from which content should be imported.
- **Branch:** Enter the branch to use for content import.

8. Test the connection. The **Test connection** button is enabled only after you enter the required details. If the connection details are correct, a success message appears. Otherwise, an error message appears.
